

ARRK helps client to support our boys on the front line.

ARRK was able to assist Kent Periscopes with the development, and subsequent low volume production of their periscopes for military fighting vehicles, using its rapid metal casting service.

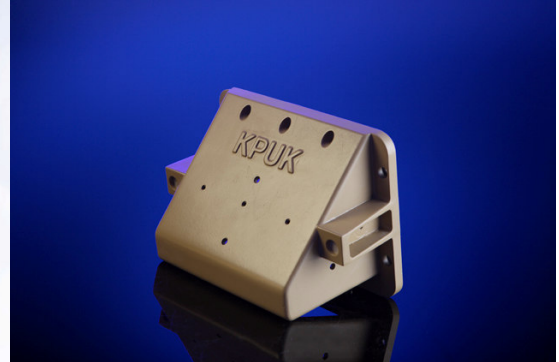

Given that the components were going to be used on military vehicles, such as those destined for use in Afghanistan and Iraq, time was of vital importance for the client.

ARRK's team of project advisers and co-ordinators set to work immediately and within a few hours of receiving the specification ARRK had quoted to supply 25 castings in aluminium LM24 offering a delivery time of three weeks. ARRK was able to respond to the client's needs so quickly because it has its own in-house foundry, specialising in rapid low volume production type castings in a range of aluminium or zinc materials.

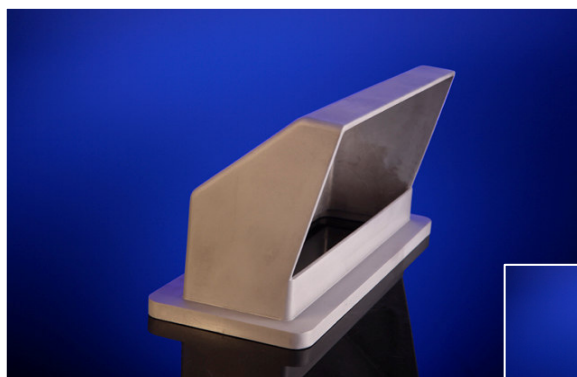

The client also specified that the components should have inserts and be supplied in a finished condition including aochrome and paint, all of which ARRK was able to provide using its in-house Paint and CNC departments. In accordance with the client's wishes, ARRK were also able to spray the components with special non infrared detection paint as requested.

By taking advantage of ARRK's wide range of in-house services the client saved valuable time and effort as a result of not having to source a number of different suppliers to complete his project.

The customer has been delighted with ARRK's rapid metal casting service and has continued to use ARRK as a source for their low volume production needs. The initial requirements of 25 casting has grown into several hundred parts and Kent Periscopes have also added other parts from their range.

Fully finished and painted Aluminium Casting

For more information about ARRK's RPM gravity die casting process in aluminium or zinc materials please contact projects on 01452 727788 or email us at projects@arrkeurope.com (please note you should also use this email address to attach data when requesting a quotation from us).
